Documentation of the Website

In this exercise, I extract 10 newest questions and 10 most-voted questions on stackoverflow both related to android, and display them on the website.

In order to parse, extract, and manipulate data stored in HTML documents on stackoverflow, I used jsoup library.

I also use CSS, JavaScript for setting elements in website. A sidebar menu which by selecting items, page scrolls to the selected title and also the titles change color by moving on them.

As the extra cool feature I put the questions tag other than android, but unfortunately that part is not debugged yet.

Finally, I have extracted the .jar executable file of project in order to help you scape downloading libraries and set other dependencies.
